HUMAN CAPITAL FORMATION AND THE CHILDHOOD DISEASE ENVIRONMENT: EVIDENCE FROM RURAL PUBLIC HEALTH IMPROVEMENTS

This paper investigates the persistent effect of an improved childhood disease environment on adult human capital. Over the years 1908 to 1933 public and private agencies in the United States instituted county-level health departments (CHDs) that provided sanitation and health services geared toward children. I exploit variation in exposure to CHDs and map the benefits into adulthood. Children treated under age five show later-life earnings improvements by 3-4 percent. I investigate the channels for this effect, focusing on health and schooling, and demonstrate that human capital improvements result from better adult health, measured by cognition and BMI.
